

How is the shop performing?

An evidence-led dashboard for the Head of Operations

How much revenue is recorded?

3.50M

All order statuses included

How many order lines?

50,000

50,000 rows in the working file

What is average order value?

70.08

Revenue per order line

How many units were ordered?

94,172

Quantity across all statuses

How many customers ordered?

9,940

Distinct active customers

What share is cancelled / returned?

8.01%

Order lines not completed

What share of payments fails?

3.85%

Failed payment records

Which category leads revenue?

50.8%

Electronics share

Three findings to take into the meeting

01

The revenue pattern changed in 2026.

February–June 2026 averaged 83,488 per month, 32.4% below January 2024–January 2026. The decline needs investigation; its cause is not established.

02

Revenue depends on a small set of leaders.

Electronics contributes 50.8% of revenue; Tehran contributes 27.6%. Accessories leads category unit volume, while Headphones leads product revenue.

03

Discounts coincide with lower order values.

Average order value falls from 74.87 at 0% discount to 55.65 at 30%. Units per order line remain close to 1.9. This is an association, not proof of causation.

Revenue over time & category mix

Question: where is revenue coming from, and where has the pattern changed?

Is monthly revenue growing, shrinking or flat?

Finding. Revenue was broadly stable in 2024–2025, with isolated peaks rather than clear recurring seasonality. February 2026 marks a sharp decline.

Which categories earn most?

Which categories sell most?

Electronics leads value; Accessories leads units. Stock decisions should distinguish revenue from volume.

Product leaders: value is not volume

Question: are the highest-revenue products also the best-selling products?

Which products earn most?

Revenue

Which products sell most?

Units

Revenue leader: Headphones. Recorded revenue is 338,078, narrowly ahead of Office Chair at 333,846. These higher-value products matter even with lower unit counts.

Volume leader: Notebook. Its 10,473 units exceed Phone Case and USB-C Cable. The top unit sellers are not the top revenue earners; track both measures.

Where customer value is concentrated

Question: which cities and customer segments generate the most revenue?

Which cities are most valuable?

Tehran accounts for 27.6% of revenue. Its 965,840 is 2.2 times Mashhad’s 439,199. Prioritise reliable fulfilment in Tehran without ignoring the rest of the customer base.

Which segments are most valuable?

Regular customers contribute 55.7%. New customers contribute 34.6% and VIPs 9.7%. Revenue share alone cannot establish VIP programme performance; customer counts and spend per customer are also needed.

Completion & payment reliability

Question: how much activity is lost, and does payment method make a difference?

What happens to orders?

Share of order lines (%)

8.01% are cancelled or returned. Cancellation is 4.94%; returns are 3.06%. These are order-line shares, not the share of revenue lost.

What happens to payments?

Share of payment records (%)

3.85% of payment records fail. Payment and order statuses measure different things and should not be added together.

Do payment methods fail equally?

Failure rate (%)

Failure rates are similar across known methods. Cash is lowest at 3.64%; CardToCard is highest at 3.89%. Check the full checkout journey before attributing the issue to one provider.

The Unknown group records 4.00% failure. Its small size makes the rate less reliable.

Discounts & basket size

Question: do bigger discounts lead to bigger orders, or lower recorded value?

Average order value

Units per order line

Finding. Average order value is 25.7% lower at 30% discount than at no discount, while units per order line range only from 1.87 to 1.90. The grouped data shows no meaningful basket-size increase, but differences in product mix may also explain the pattern.

Overall summary

The shop records 3.50M across 50,000 order lines. The 2026 decline is the immediate concern; Electronics and Tehran are the largest revenue concentrations. Cancellations, returns and failed payments merit attention. Review discount effectiveness through controlled testing rather than assuming a causal effect.

Three recommendations

The priorities below translate the evidence into decisions for the Head of Operations.

01 Investigate the 2026 revenue decline first.

Compare February–June 2026 with prior months for order volume, prices, stock availability and site/payment issues. Begin with Electronics and Tehran, the largest revenue concentrations.

Evidence: monthly average falls from 123,472 to 83,488 (–32.4%).

02 Test bundles instead of blanket discounts.

Compare targeted bundles with current promotions using a controlled test. Measure units per order, average order value and gross margin before expanding any offer.

Evidence: order value falls from 74.87 to 55.65; units remain around 1.9.

03 Reduce order loss and measure repeat-customer value.

Review cancellation and return reasons, introduce appropriate payment retry reminders, and evaluate Regular-to-VIP offers using retention and spend per customer.

Evidence: 8.01% cancelled/returned; 3.85% payment failure; Regular share 55.7%.

Step 7: the business story

The story opens with three key findings, answers each business question with a chart and its implication, then closes with three number-backed actions. The priority is to understand the new revenue decline before changing stock, pricing or customer offers.

Data & interpretation notes

Revenue = Quantity × UnitPrice × (1 – Discount). All order and payment statuses are included to match the workbook, so revenue is not verified cash collected. Blank segments and payment methods remain as Unknown. Counts use order lines; figures may differ slightly due to rounding. No currency is specified.
